AutoCAD currently holds the market shares of 1% to 2% of all applications used by architects and engineers worldwide. History AutoCAD history began in 1968, when Chuck Peddie (a technical marketing director at Data General) and Eugene Schiller (a programmer and documenter at Data General) formed a team to create a new CAD program. It was their intention to create a program that would increase the user's productivity, but remain easy to use. The team began by creating a small application that could draw simple geometric objects. They then created an interface to connect it to a Data General 4110 minicomputer. A basic problem with this application was that the computer could only store about 80 objects, the standard number of objects that the program was designed to draw. To overcome this limitation, they changed the application's design so that it would communicate with the computer by using a feature known as a "batch file" and a command called "open." This gave the application the ability to store any number of objects and draw them at any time without a limitation. They also decided to allow users to move objects around the screen and group them into "sheets" that could then be edited, in essence allowing them to edit documents that looked like drawings. The first version of the program was named DIGOR. At that time, the computer industry was only just beginning to turn its attention to computer-aided design and drafting (CAD). The team was interested in its commercial success and with that in mind, they named their company "AutoDesign" for the reason that "a file is only as good as its last edit." Peddie left the company in 1969 to join a venture capital firm, but continued to work on the software for another three years. He also worked with the market research firm of ARF Associates to study the market for a new CAD program. In 1971, ARF Associates' market research showed that both the price and the lack of a mechanism for sharing ideas made the CAD market fragmented. In this respect, the

idea of a CAD system and the market for that software was very different from the commercial software market that Peddie was used to. This distinction left the development of CAD software lagging behind other software markets. After leaving ARF Associates, Chuck Peddie left the company in 1972. He quickly joined a venture capital firm where he was a consultant until 1975. That same year, Eugene Schiller re-joined the company and the
